Template: Opportunity Evaluation Matrix

Step-by-step instructions

1. Select your 10-12 best opportunities from the Opportunity Mapping. They do not have to be based on the same focus area.

2. Transfer the selected opportunities onto the Opportunity Evaluation Matrix. You can discuss the value and complexity of the opportunity.
• For value, you can consider how much new value will be gained for the stakeholder.
• For complexity, you can consider what it takes to make this change.

3. Select the five opportunities that provides the highest value with low complexity. Insert the selected opportunities on page 3 of the worksheet.

4. Indicate on page 3 of the template which stakeholders will gain value from the opportunities.

5. Now, describe each of the selected opportunities in 3-4 sentences. The description should briefly describe the intention of the opportunity and the **offers it brings to the specific stakeholder**.

6. Pro tip: Use numbered dots in the matrix and further elaboration underneath

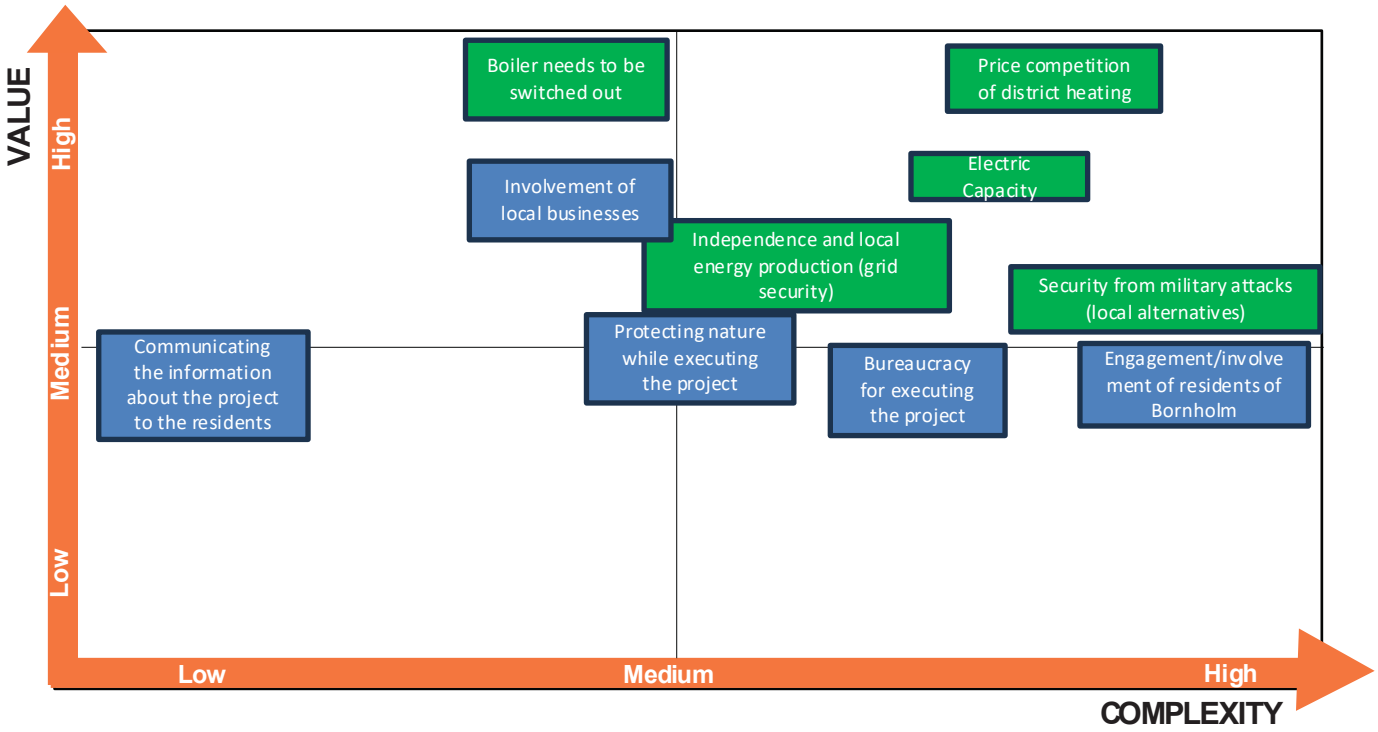

Facilitator Tips

• After having selected top 10-12 opportunities, you should engage the team in a discussion about the level of value and complexity for each opportunity in order to place them in the matrix.

• If an opportunity provides low 'value' and/or has a lot of 'complexity', do not spent too much time on a precise placement in the matrix - spend more time on the best performing (high value and low complexity) opportunities.

• Remember, if at any point you don't have to be actively involved in the discussion, you may begin planning for the next day.

Template: Opportunity Evaluation Matrix

Opportunity #1: Boiler needs to be changed due to end-of-life time

Description of the opportunity:
The current boiler is too old (very near end-of-life)and needs to be switched out. Furthermore, the municipality has set a goal to reduce the use biomass. It would be essential to make a solution that avoids biomass and is sufficient in terms of the electric capacity on Bornholm. This creates an opportunity to rethink how heat can be produced on the island while maintaining a reliable supply. The opportunity could benefit BEOF, residents and the municipality by supporting a more sustainable and reliable future heating system.

Which stakeholders will gain from this opportunity? Elaborate why.
BEOF is gaining from this opportunity because they reach their goal of reducing their biomass consumption making them more independent and stabilize the price for their customers making it cheaper. Additionally, they are investing in a sustainable future which will be the biggest challenges in the future. Another stakeholder are the residents from Bornholm that will (hopefully) get cheaper district heating prices.

Opportunity #2: Low Electric Capacity; The electric capacity needs to be increased on the island

Description of the opportunity:
This is an opportunity to have more local renewable energy production. This could make Bornholm less reliant on the cable from Sweden, along with moving jobs to the island. Furthermore, it is an opportunity to explore which different renewable energy sources will best fit the need of Bornholm until and after the introduction of the Energy Island. Therefore, the limited capacity represents an opportunity to explore how Bornholm's future energy needs can be supported.

Which stakeholders will gain from this opportunity? Elaborate why.
The residents on Bornholm will gain from this opportunity, with potentially better energy prices and better energy availability in general. Furthermore, it could support more businesses on the island, as they now have the capacity to expand. It could also be interesting for investors to be a part of local energy projects on the island.

Opportunity #3: Price competition of district heating

Description of the opportunity:
With the current prices of district heating for residents of Bornholm, it is too expensive and they have the opportunity (and incentive) to switch to heating pumps instead. The current price of district heating can make alternative heating solutions more attractive to residents. This creates an opportunity to make district heating more competitive while maintaining a reliable and sustainable heating system. Residents could benefit from more affordable heating, while BEOF could benefit from maintaining district heating as an attractive option for customers.

Which stakeholders will gain from this opportunity? Elaborate why.
Local residents and BEOF could benefit from this opportunity. Residents could get more affordable and stable heating prices, which would reduce their energy costs. BEOF could also benefit by keeping district heating competitive compared with individual heating solutions such as heat pumps. Bornholm Municipality could benefit as well, because affordable district heating could support the local green energy transition.

Opportunity #4: Security from military attacks (local alternatives)

Description of the opportunity:
Bornholm is partly dependent on external energy sources and connections. This could create risks if the energy supply is interrupted, especially during conflicts or other emergencies. Developing more local energy alternatives, such as PV and energy storage, could reduce external dependence and improve Bornholm's energy security. The situation therefore provides an opportunity to strengthen Bornholm's ability to maintain a stable energy supply during disruptions.

Which stakeholders will gain from this opportunity? Elaborate why.
Local residents, businesses, BEOF and Bornholm Municipality could all benefit. Residents and businesses could have a more stable energy supply and face a lower risk of energy shortages. BEOF could improve the reliability of the local energy system, while the municipality could benefit from better energy security and less dependence on external energy sources.

Opportunity #5: Independence and local energy production (grid security)

Description of the opportunity:
Energy cables on Bornholm are sometimes affected/blocked by outside interferences, and they have to use fossil fuels in that period. Furthermore, Bornholm buys biomass from the Baltic countries making them reliant on foreign prices and production. A local energy production that is self sufficient to avoid always using fossil fuels. This creates an opportunity to strengthen the resilience of Bornholm's energy system while potentially creating new value for residents, businesses and BEOF. The opportunity is therefore to explore how greater local energy independence could support a more secure and sustainable energy future for Bornholm.

Which stakeholders will gain from this opportunity? Elaborate why.
The residents on bornholm will gain from this opportunity, having a better and local energy production that don't result in power loss for a short amount of time.
